Sinopsis

ISBN: 9781841844848

In Further Targeted Therapies in Rheumatology, the editors of the successful Targeted Therapies in Rheumatology return to the subject to look at how this rapidly moving field has developed in the intervening period. Many completely new therapies have now been added to what was known previously. The book contains 100 illustrations and is edited by an international team, with contributions from experts. Topics include cells and cell surface receptors, cytokines, chemokines, and other effector molecules, transcription factors and signaling molecules, inflammatory mediators, matrix molecules, as well as human and experimental rheumatic diseases.
