Sinopsis

ISBN: 9780787964580

This textbook is intended to serve as the foundation of an introductory course in statistics for health care administration or health policy students. The first six chapters introduce the uses of statistics in health policy and administration, the various capabilities of Microsoft Excel, and foundational notions from probability. Every succeeding chapter explores the definition and techniques of hypothesis testing. Excel is used without any particular statistics pack to illustrate these techniques, and the book derives its health-related flavor from the numerous examples, all of which are drawn from health policy and administration.
