**Título:** Conserving Forest Biodiversity. A Comprehensive Multiscaled Approach

**Autor:** Lindenmayer, David B/ Franklin, Jerry F

**Precio:** \$693.00

**Editorial:**

**Año:** 2002

**Tema:**

**Edición:** 1ª

**Sinopsis**

**ISBN:** 9781559639354

While most efforts at biodiversity conservation have focused primarily on protected areas and reserves, the unprotected lands surrounding those areas—the "matrix"—are equally important to preserving global biodiversity and maintaining forest health. In *Conserving Forest Biodiversity*, leading forest scientists David B. Lindenmayer and Jerry F. Franklin argue that the conservation of forest biodiversity requires a comprehensive and multiscaled approach that includes both reserve and nonreserve areas. They lay the foundations for such a strategy, bringing together the latest scientific information on landscape ecology, forestry, conservation biology, and related disciplines as they examine:

- the importance of the matrix in key areas of ecology such as metapopulation dynamics, habitat fragmentation, and landscape connectivity
- general principles for matrix management
- using natural disturbance regimes to guide human disturbance
- landscape-level and stand-level elements of matrix management
- the role of adaptive management and monitoring
- social dimensions and tensions in implementing matrix-based forest management

In addition, they present five case studies that illustrate aspects and elements of applied matrix management in forests. The case studies cover a wide variety of conservation planning and management issues from North America, South America, and Australia, ranging from relatively intact forest ecosystems to an intensively managed plantation.

*Conserving Forest Biodiversity* presents strategies for enhancing matrix management that can play a vital role in the development of more effective approaches to maintaining forest biodiversity. It examines the key issues and gives practical guidelines for sustained forest management, highlighting the critical role of the matrix for scientists, managers, decisionmakers, and other stakeholders involved in efforts to sustain biodiversity and ecosystem processes in forest landscapes.

About the Author

David B. Lindenmayer is senior research fellow and associate professor at the Centre for Resource and Environmental Studies at The Australian National University in Canberra. Jerry F. Franklin is professor of ecosystem science in the College of Forest Resources at the University of Washington in Seattle and co-author of *Creating a Forestry for the Twenty-First Century* (Island Press, 1998).
