Edición: 1^a

Sinopsis

ISBN: 9783642050916

Based on a series of lectures the author prepared for adult students at Reading University in the UK, this lively and entertaining book proves that, far from being a dusty, dull subject, geometry is in fact full of beauty and fascination. The author's infectious enthusiasm is put to use in explaining many of the key concepts in the field, starting with the Golden Number and taking the reader on a geometrical journey via Shapes and Solids, Circles and Spheres, Projective Geometry and Topology, into and out of the Fourth Dimension, and finishing up with Einstein's Theories of Relativity.

Aimed at a general readership, and requiring only a basic understanding of mathematics, the text uses examples such as soap bubbles to make accessible complex subjects such as Chaos and Fractals, Steiner's porism and Soddy's Hexlet. It includes a wealth of the author's own diagrams and illustrations, of which several are in stereo. As well as material based on the lectures themselves, including sets of exercises, the book features a number of appendices that cover related topics and provide further reading and information.

Equally ideal as an educational gift for a youngster or as a nostalgic journey back into the world of mathematics for older readers, John Barnes' book is the perfect antidote for anyone whose maths lessons at school are a source of painful memories. Where once geometry was a source of confusion and frustration, Barnes brings enlightenment and entertainment.
