**Título:** Semiconductor Catalysis And Photocatalysis On The Nanoscale

**Autor:** Stroyuk, Oleksander L. ; Stepan Ya. Kuchmiy; Anatoliy I. Kryu **Precio:** \$1568.00

**Editorial:** **Año:** 2010

**Tema:** **Edición:** 1ª

**Sinopsis** **ISBN:** 9781617287886

This book reviews the modern state of the catalysts and photocatalysis of chemical reactions by semiconductor nanoparticles and nanoheterostructures with the main accent on the light-driven processes. A background and principles of the semiconductor nanophotocatalysis - a new trend in photochemistry dealing with the photocatalytic redox-reactions with the participation of semiconductor nanoparticles - is discussed. A general character of the fundamental principles of the nanophotocatalysts and the 'classical' photocatalysis by microcrystalline semiconductors is combined with prominent differences originating from the spatial exciton confinement typical for ultra-small semiconductor nanoparticles.
